

Team and project selection form, COMPSCI 4ZP6

Each student uploads individually, but team members should upload the exact same file with the same name.

Team members (minimum is 5, maximum is 7):

Full name (as seen on Avenue)	McMaster Email address	Student Number
Kris Vuong	vuongk3@mcmaster.ca	400461086
Hudson Sheng	shengh8@mcmaster.ca	400455599
James Jeon	jeonj10@mcmaster.ca	400457305
Gray Niederhuber	niederhg@mcmaster.ca	400332511
Eunsu Kim	kime46@mcmaster.ca	400308060
Oliver Li	li2177@mcmaster.ca	400437336

Project information:

Project title	SpecFlow (tentative)
Supervisor name	N/A (self-proposed idea)
Supervisor email	
Link to GitHub repo (make sure the instructor and TAs are added as collaborators)	https://github.com/AG-GROUP-LIMITED/COMPSCI_4ZP6_CAPSTONE

Project description (~100 to ~200 words, please stay within this page, use font size 10):

This application targets project managers of small to medium sized teams and will act as a general purpose project management visualization tool and software technical specification sheet manager. It will provide structured input for team members to contribute necessary project information throughout the development phase, including meeting notes, requirements incurred, features derived, tasks associated, architecture designs, decisions made, use cases, target audiences, and any other components that are worth capturing to ensure the maintainability of the product. Once all necessary info is recorded, the members can generate standardized technical documentation with one button click. This targets the pain point of having unorganized design artifacts and evidence spread across multiple sources, and the eventual technical documentation compilation ends up either consuming precious time or losing precious information.

At the same time, the application would visualize the progress and relationship of the entire project via visually mapping the complex relational dependencies of tasks and subtasks. This helps teams identify components that are blocking development. This visualization aims to facilitate understanding of the project as a whole, and this responsibility and need to understand the entire project (when it scales up) often falls onto project managers' shoulders. They have to coordinate among members, spot which part of the project needs addressing and allocate resources there.
